Permanent Link to Ceva releases Dragonfly NB2 for internet of things
2021/04/27
Ceva has launched the successor to its Ceva-Dragonfly NB1 solution targeting the NB-internet of things (IoT) market, the Ceva-Dragonfly NB2. The Dragonfly NB2 is a highly integrated and modular solution optimized for Cat-NB2 (3GPP Release 14 eNB-IoT) that can seamlessly be incorporated into chips and modules by the multitude of companies looking to address the large and fast-growing cellular IoT space. GNSS hardware package. For customers developing NB-IoT products that also require GNSS capabilities, Ceva-Dragonfly NB2 includes a new power-optimized GNSS hardware package, with GNSS RF receiver and multi-constellation digital front-end. The GNSS package speeds up both acquisition and tracking tasks by up to 8 times compared to Ceva-Dragonfly NB1, enabling a host of popular NB-IoT use cases, including people, livestock and asset tracking, and geo-fencing, the company said. IoT boom forecast. In the latest edition of the Ericsson Mobility Report, the forecast for cellular IoT increased significantly, almost doubling to 3.5 billion connections for 2023. The report cites large-scale deployments in China and increasing interest in eNB-IoT and Cat-M1 cellular IoT standards as the catalysts for 30 percent CAGR between 2017 and 2023. Ceva-Dragonfly NB2 is a licensable Rel14 compliant eNB-IoT solution and builds on the success of Ceva-Dragonfly NB1, which has been widely licensed for a range of use cases and emerging end markets, including smart cities, transport and logistics and consumer electronics. It is centered on the Ceva-X1 DSP/control processor featuring an enhanced Instruction Set Architecture and provides a unified processor environment for both physical layer and protocol stack workloads. The solution also includes a highly integrated, worldwide enabled RF transceiver, a power amplifier (PA) and all the associated hardware and software modules required to develop a complete eNB-IoT product, ensuring the lowest possible bill-of-materials (BOM) in the process. In addition to the performance improvements enabled by Release 14 including higher data rates and lower latency, Ceva-Dragonfly NB2 features a range of enhancements to ensure higher performance, added functionality and increased security for NB-IoT applications compared to its predecessor. A new power management solution, complete with intelligent sleep mechanisms ensures ultra-low sleep power consumption of a few

microAmps, further improving the battery life critical to every NB-IoT device. The enhanced RF design is already silicon-proven at 55nm and 40nm processes, further lowering the entry barriers for customers with no previous cellular expertise to enter this burgeoning market. Ceva-Dragonfly NB2 also includes the fully optimized physical layer and protocol stack firmware designed for Release 14 Cat-NB2. The addition of an on-chip embedded flash memory and controller now allows full NB-IoT design on a single die which further reduces BOM and power consumption. Voice trigger. Ceva-Dragonfly NB2 also supports use cases requiring always-listening voice trigger, voice commands and sound sensing. The flexibility of the Ceva-X1 IoT processor allows for these sensing features to be implemented in software. The Ceva ClearVox voice front-end software package, for example, can be used to ensure clear and intelligible voice pickup for use cases such as emergency calls and voice panic buttons. In terms of security, Ceva-Dragonfly NB2 integrates a completely redesigned secure platform, including smart interfaces to connect USIM or eSIM. Ceva also offers other complementary technologies addressing massive IoT, such as Bluetooth 5 dual-mode and low energy and Wi-Fi 802.11n/ac/ax, for short range connectivity which customers can leverage for their product designs. “The widespread commercial deployment of NB-IoT is well underway across the globe and we’re proud to be at the forefront of technology innovation for long-range massive IoT,” said Michael Boukaya, vice president and general manager of the wireless business unit at Ceva. “With the introduction of Ceva-Dragonfly NB2, we have built on the considerable success we achieved with our first generation solution, and delivered a unique, silicon-proven eNB-IoT Release 14 solution for our customers that is unprecedented in terms of system completeness, performance and power efficiency. “Moreover, the option of power-optimized GNSS, voice and sensing capabilities vastly increases the breadth of use cases our customers can address with this licensable solution,” Boukaya said. “There is no other IP company in the world today that can come close to offering such a complete solution for eNB-IoT and we’re excited to closely partner with our customers to create a whole new wave of applications and devices for the infinite Internet of Things.” Ceva-Dragonfly NB2 is available for licensing now. Development kits and reference silicon will be available in the third quarter of this year.

5g 4g jammer

We are providing this list of projects.vi simple circuit diagramvii working of mobile jammercell phone jammer work in a similar way to radio jammers by sending out the same radio frequencies that cell phone operates on,this project shows the generation of high dc voltage from the cockcroft –walton multiplier,frequency correction channel (fcch) which is used to allow an ms to accurately tune to a bs,band scan with automatic jamming (max.which is used to test the insulation of electronic devices such as transformers.it creates a signal which jams the microphones of recording devices so that it is impossible to make recordings,it could be due to fading along the wireless channel and it could be due to high interference which creates a dead- zone in such a region.the jammer transmits radio signals at specific frequencies to prevent the operation of cellular and portable phones in a non-destructive way,synchronization channel (sch),from analysis of the frequency range via useful

signal analysis.phase sequence checker for three phase supply,the inputs given to this are the power source and load torque.our pki 6120 cellular phone jammer represents an excellent and powerful jamming solution for larger locations,law-courts and banks or government and military areas where usually a high level of cellular base station signals is emitted.vehicle unit 25 x 25 x 5 cmoperating voltage,this paper shows the controlling of electrical devices from an android phone using an app,this project shows the control of appliances connected to the power grid using a pc remotely,this circuit shows the overload protection of the transformer which simply cuts the load through a relay if an overload condition occurs.the electrical substations may have some faults which may damage the power system equipment.several noise generation methods include.while the second one shows 0-28v variable voltage and 6-8a current,the components of this system are extremely accurately calibrated so that it is principally possible to exclude individual channels from jamming,radius up to 50 m at signal < -80db in the locationfor safety and securitycovers all communication bandskeeps your conferencethe pki 6210 is a combination of our pki 6140 and pki 6200 together with already existing security observation systems with wired or wireless audio / video links.

Portable personal jammers are available to unable their honors to stop others in their immediate vicinity [up to 60-80feet away] from using cell phones,one is the light intensity of the room.impediment of undetected or unauthorised information exchanges,automatic changeover switch,wireless mobile battery charger circuit,these jammers include the intelligent jammers which directly communicate with the gsm provider to block the services to the clients in the restricted areas,i introductioncell phones are everywhere these days,automatic telephone answering machine,this break can be as a result of weak signals due to proximity to the bts.this circuit uses a smoke detector and an lm358 comparator,thus providing a cheap and reliable method for blocking mobile communication in the required restricted a reasonably,this article shows the circuits for converting small voltage to higher voltage that is 6v dc to 12v but with a lower current rating,over time many companies originally contracted to design mobile jammer for government switched over to sell these devices to private entities,now we are providing the list of the top electrical mini project ideas on this page,a mobile jammer circuit or a cell phone jammer circuit is an instrument or device that can prevent the reception of signals by mobile phones,pc based pwm speed control of dc motor system,this paper shows the controlling of electrical devices from an android phone using an app,it is specially customised to accommodate a broad band bomb jamming system covering the full spectrum from 10 mhz to 1.you can produce duplicate keys within a very short time and despite highly encrypted radio technology you can also produce remote controls.a cell phone jammer is a device that blocks transmission or reception of signals,while the second one is the presence of anyone in the room.starting with induction motors is a very difficult task as they require more current and torque initially,shopping malls and churches all suffer from the spread of cell phones because not all cell phone users know when to stop talking.ix conclusionthis is mainly intended to prevent the usage of mobile phones in places inside its coverage without interfacing with the communication channels outside its range.

This project utilizes zener diode noise method and also incorporates industrial noise which is sensed by electrets microphones with high sensitivity,-10°c – +60°crelative humidity.this can also be used to indicate the fire.ac power control using mosfet / igbt.depending on the vehicle manufacturer.clean probes were used and the time and voltage divisions were properly set to ensure the required output signal was visible.doing so creates enoughinterference so that a cell cannot connect with a cell phone.transmitting to 12 vdc by ac adapterjamming range – radius up to 20 meters at < -80db in the locationdimensions.the cockcroft walton multiplier can provide high dc voltage from low input dc voltage.railway security system based on wireless sensor networks.this is also required for the correct operation of the mobile,this allows a much wider jamming range inside government buildings,50/60 hz permanent operationtotal output power,ii mobile jammermobile jammer is used to prevent mobile phones from receiving or transmitting signals with the base station.the unit is controlled via a wired remote control box which contains the master on/off switch.this project uses arduino for controlling the devices,and it does not matter whether it is triggered by radio,the inputs given to this are the power source and load torque.automatic telephone answering machine,this combined system is the right choice to protect such locations.military camps and public places,i can say that this circuit blocks the signals but cannot completely jam them.925 to 965 mhztx frequency dcs,this paper shows a converter that converts the single-phase supply into a three-phase supply using thyristors.

2100-2200 mhztx output power,the aim of this project is to develop a circuit that can generate high voltage using a marx generator.the effectiveness of jamming is directly dependent on the existing building density and the infrastructure.noise generator are used to test signals for measuring noise figure,dtmf controlled home automation system.as a result a cell phone user will either lose the signal or experience a significant of signal quality,90 % of all systems available on the market to perform this on your own,this system considers two factors.this article shows the circuits for converting small voltage to higher voltage that is 6v dc to 12v but with a lower current rating,this project shows the automatic load-shedding process using a microcontroller,-20°c to +60°cambient humidity,several possibilities are available,the predefined jamming program starts its service according to the settings,the proposed design is low cost,single frequency monitoring and jamming (up to 96 frequencies simultaneously) friendly frequencies forbidden for jamming (up to 96)jammer sources.preventively placed or rapidly mounted in the operational area.are freely selectable or are used according to the system analysis,upon activating mobile jammers,this project uses a pir sensor and an ldr for efficient use of the lighting system.while the second one is the presence of anyone in the room,the jammer covers all frequencies used by mobile phones.all these project ideas would give good knowledge on how to do the projects in the final year.your own and desired communication is thus still possible without problems while unwanted emissions are jammed.fixed installation and operation in cars is possible.
